

SYMPHONY OF MUSHROOMS

ALEXANDRA KUNERT

We have more in common than we think...

Like the human nervous system, fungi also send electrical signals to gather information and response to environmental changes. Plus, they can use these signals to communicate with other plants and fungi within their network.

This kind of science has been used on plants, but lately, mushrooms have taken the lead...

When mushroom or plant music is made, the natural matter is connected via electrodes to a device that can measure galvanic conductance from outside the organism's skin, similar to how a lie detector works.
